Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat

By [Nilanchala \(http://stacktips.com/author/nilanchala\)](http://stacktips.com/author/nilanchala) | updated 1 day ago[stacktips.com \(http://stacktips.com\)](http://stacktips.com) [npanigrahy \(https://twitter.com/npanigrahy\)](https://twitter.com/npanigrahy)

In the course of this tutorial, we will learn how to create your first Spring MVC application using eclipse IDE using Maven build type.

1. Prerequisites

1. [Create a Maven Project](#)
3. [Create a Server Instance](#)
4. [Update Project Build Path](#)
5. [Configure Spring Dependency](#)
6. [Configure Dispatcher Servlet](#)
7. [Mapping Requests](#)
8. [Create Controller class](#)
9. [Working with Views](#)

1. Prerequisites

- Java version 1.7
- Latest Spring STS
- Apache Tomcat 7.0.x

This tutorial assumes that, you have downloaded and installed the above mentioned softwares on your computer. If you have not installed Java on your development machine, you can follow the official oracle documentation for the installation for your configuration.

Without spending any further time, let us jump straight into creating the project in eclipse.

1. Create a Maven Project

- **File -> New -> Other...** It will open the eclipse select wizard.

(<http://st1.vchensubeswogfpjq.netdna->

[cdn.com/wp-content/uploads/2015/09/Create-Maven-Spring-project.png](http://st1.vchensubeswogfpjq.netdna-cdn.com/wp-content/uploads/2015/09/Create-Maven-Spring-project.png))

- Select **Maven** -> **Maven Project** and click **Next**.
- Again click **Next** on New Maven Project dialog.
- Select an Archetype either by filtering **webapp** or selecting from the available artifacts and click **Next**.

(<http://st1.vchensubeswogfpjoq.netdna-cdn.com/wp-content/uploads/2015/09/Create-new-eclipse-maven-project.png>)

- Provide the details for Group Id and Artifact Id and click **Finish**. As a general practice, the group id is your company domain name (i.e. com.javatechig) and artifact id is the name of your application.
- This will create a basic Maven project template in eclipse.

3. Create a Server Instance

In this example we will be using **Apache Tomcat** application server for deploying our Spring MVC application. Now let us add a server instance on eclipse.

- **File** -> **New** -> **Other...** It will open the eclipse select wizard.

([http://st1.vchensubeswogfpjoq.netdna-](http://st1.vchensubeswogfpjoq.netdna-cdn.com/wp-content/uploads/2015/09/Add-Tomcat-Server-Eclipse.png)

[cdn.com/wp-content/uploads/2015/09/Add-Tomcat-Server-Eclipse.png](http://st1.vchensubeswogfpjoq.netdna-cdn.com/wp-content/uploads/2015/09/Add-Tomcat-Server-Eclipse.png))

- Select Server -> Server and click **Next**.
- Select Apache -> **Tomcat v7.0 Server** and click **Next**. In this example, we will be using Apache Tomcat version 7.0. However, the similar steps will work for other tomcat versions.
- Browse and select the **Apache Tomcat v7.0** server installation directory and click **Finish**.

4. Update Project Build Path

You might notice a error on your project. This is due to the project Build path problem. To fix this you need to right click on project -> **Properties** to open project Java Build Path settings.

Select **Libraries** tab and click on **Add Library...**-> **Server Runtime** -> **Apache Tomcat** -> **Finish**.

5. Configure Spring Dependency

Before we develop Spring MVC web application, we need to configure the project by adding the required Maven dependencies. Add the following Maven dependencies into your `pom.xml` file.

`pom.xml`

```

<project
  xmlns="http://maven.apache.org/POM/4.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0 http://maven.apache.org/maven-v4_0_0.xsd">
  <modelVersion>4.0.0</modelVersion>
  <groupId>com.javatechig</groupId>
  <artifactId>HelloMVC</artifactId>
  <packaging>war</packaging>
  <version>0.0.1-SNAPSHOT</version>
  <name>HelloMVC Maven Webapp</name>
  <url>http://maven.apache.org</url>

  <!--Spring Library version -->
  <properties>
    <spring.version>4.2.1.RELEASE</spring.version>
  </properties>

  <dependencies>

    <!-- Spring dependencies -->
    <dependency>
      <groupId>org.springframework</groupId>
      <artifactId>spring-core</artifactId>
      <version>${spring.version}</version>
    </dependency>

    <dependency>
      <groupId>org.springframework</groupId>
      <artifactId>spring-webmvc</artifactId>
      <version>${spring.version}</version>
    </dependency>

    <dependency>
      <groupId>org.springframework</groupId>
      <artifactId>spring-web</artifactId>
      <version>${spring.version}</version>
    </dependency>

    <dependency>
      <groupId>junit</groupId>
      <artifactId>junit</artifactId>
      <version>3.8.1</version>
      <scope>test</scope>
    </dependency>
  </dependencies>
  <build>
    <finalName>HelloMVC</finalName>
  </build>
</project>

```

Twitter (<https://twitter.com/intent/tweet?text=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&url=http://stacktips.com/?p=9772&via=Stacktips>)

Share (<https://www.linkedin.com/shareArticle?mini=true&url=http://stacktips.com/?p=9772&title=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&source=http://stacktips.com/?p=9772>)

With this the basic Spring project configuration is complete. Your project structure should look like as the following screenshot.

([http://st1.vchensubeswogfpjoq.netdna-cdn.com/wp-](http://st1.vchensubeswogfpjoq.netdna-cdn.com/wp-content/uploads/2015/09/Spring-MVC-Eclipse-Maven-Project-Structure.png)

[content/uploads/2015/09/Spring-MVC-Eclipse-Maven-Project-Structure.png](http://st1.vchensubeswogfpjoq.netdna-cdn.com/wp-content/uploads/2015/09/Spring-MVC-Eclipse-Maven-Project-Structure.png))

The following steps will take you through the rest of the steps to create and deploy Spring MVC HelloWorld app.

Share (<https://facebook.com/sharer.php?u=http://stacktips.com/?p=9772&p=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat>)

6. Configure Dispatcher Servlet

The DispatcherServlet is configured as normal in creating Spring MVC app. To bootstrap Spring Web Application Context. Edit the default web.xml file and add the following

Share (<https://www.linkedin.com/shareArticle?mini=true&url=http://stacktips.com/?p=9772&title=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&source=http://stacktips.com/?p=9772>)

```

<!DOCTYPE web-app PUBLIC
"-//Sun Microsystems, Inc.//DTD Web Application 2.3//EN"
"http://java.sun.com/dtd/web-app_2_3.dtd" >

<web-app>
  <display-name>Archetype Created Web Application</display-name>
  <context-param>
    <param-name>contextConfigLocation</param-name>
    <param-value>/WEB-INF/dispatcher-servlet.xml</param-value>
  </context-param>

  <listener>
    <listener-class>
      org.springframework.web.context.ContextLoaderListener
    </listener-class>
  </listener>

  <servlet>
    <servlet-name>dispatcher</servlet-name>
    <servlet-class>
      org.springframework.web.servlet.DispatcherServlet
    </servlet-class>
    <load-on-startup>1</load-on-startup>
  </servlet>

  <servlet-mapping>
    <servlet-name>dispatcher</servlet-name>
    <url-pattern>/</url-pattern>
  </servlet-mapping>
</web-app>

```

Share (<https://facebook.com/sharer.php?u=http://stacktips.com/?p=9772&p=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat>)

7. Mapping Requests

Tweet (<https://twitter.com/intent/tweet?text=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&url=http://stacktips.com/?p=9772&via=5>)

Create an xml file dispatcher-servlet.xml under the same directory of web.xml

Share (<https://www.linkedin.com/shareArticle?mini=true&url=http://stacktips.com/?p=9772&title=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&source=http://stacktips.com/?p=9772>)

```

<beans xmlns="http://www.springframework.org/schema/beans"
       xmlns:context="http://www.springframework.org/schema/context"
       xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
       xsi:schemaLocation="
http://www.springframework.org/schema/beans
http://www.springframework.org/schema/beans/spring-beans.xsd
http://www.springframework.org/schema/context
http://www.springframework.org/schema/context/spring-context.xsd">

    <context:component-scan base-package="com.javatechig.controller" />

    <bean class="org.springframework.web.servlet.view.InternalResourceViewResolver">
        <property name="prefix">
            <value>/WEB-INF/views/</value>
        </property>
        <property name="suffix">
            <value>.jsp</value>
        </property>
    </bean>
</beans>

```

In the above xml file, base-package specifies the package of the controllers. prefix specifies the directory of views, and it is set to be /WEB-INF/views/, which means views directory should be created under WEB-INF. suffix specifies the file extension of views. For example, given a view hello, the view will be located as /WEB-INF/views/hello.jsp.

8. Create Controller class

Create the HelloWorldController under src/main/java/ directory.

Share (<https://facebook.com/sharer.php?u=http://stacktips.com/?p=9772&p=Creating Spring MVC HelloWorld Using Maven in Eclipse>)
HelloWorldController.java Tomcat)

Tweet (<https://twitter.com/intent/tweet?text=Creating Spring MVC HelloWorld Using Maven in Eclipse>)
package com.javatechig.controller; Tomcat&url=http://stacktips.com/?p=9772&via=Stacktips)

Share (<https://www.linkedin.com/shareArticle?mini=true&url=http://stacktips.com/?p=9772&title=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&source=http://stacktips.com/?p=9772>)

```

import org.springframework.web.bind.annotation.RequestMapping;
import org.springframework.web.bind.annotation.RequestParam;
import org.springframework.web.servlet.ModelAndView;

@Controller
public class HelloWorldController {

    @RequestMapping("/hello")
    public ModelAndView welcomeMessage(
        @RequestParam(value = "name", required = false) String name) {
        // Name of your jsp file as parameter
        ModelAndView view = new ModelAndView("hello");
        view.addObject("name", name);
        return view;
    }
}

```

In the code above, @RequestMapping annotation maps web requests onto specific handler classes and/or handler methods, in this case, welcomeMessage(). It provides a consistent style between Servlet environments, with the semantics adapting to the concrete environment.

RequestParam indicates that a method parameter should be bound to a web request parameter. In this case, we also make it not required and give it a default value. The ModelAndView("hello") determines that hello is the target view.

9. Working with Views

Edit the default index.jsp and add the following code snippets.

index.jsp

```
<html>
<body>
    <h2>Hello World</h2>
    <h3><a href="hello?name=Sally">Click here...</a></h3>
</body>
</html>
```

Add a JSP files hello.jsp file under /WEB-INF/views/ directory.

hello.jsp

```
<%@ page language="java" contentType="text/html; charset=UTF-8"
    pageEncoding="ISO-8859-1"%>
<!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4/loose.dtd">
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=UTF-8">
<title>Spring 4 MVC</title>
<%@ page isELIgnored="false"%>
</head>
<body>
    <h2>Hello, ${name}. Welcome to Spring MVC!</h2>
</body>
</html>
```

Share (<https://facebook.com/sharer.php?u=http://stacktips.com/?p=9772&p=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat>)

Tweet (<https://twitter.com/intent/tweet?text=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&url=http://stacktips.com/?p=9772&via=Stacktips>)

Share (<https://www.linkedin.com/shareArticle?mini=true&url=http://stacktips.com/?p=9772&title=Creating Spring MVC HelloWorld Using Maven in Eclipse Tomcat&source=http://stacktips.com/?p=9772>)

Now we are done with our first HelloWorld example. To deploy it on Tomcat application server, Right click on the project -> select **Run as**. Choose **Tomcat server**, select **Next** and **Finish**. It will deploy the project and to see the output visit <http://localhost:8080/HelloMVC> on your browser. you will see the following output on your browser.

Hello World

Hi Nilanchala,
This solution really helpful.
Thank you so much for posting!

Dear,

Can you explain me how to put an image as a logo or as a background? Because I got a mapping error with a simple call

Regards

Tomcat)

Some things are missing like not getting "project -> select Run as. Choose Tomcat server" option and whether to create package id, I also feel that the screen shot showing folder structure should be updated. Showing each and every file.
